Jun 25, 2020 - This is a must-read! Liliانا Krstic, the author of the best-selling book "Sugar Moms," has a. Jul 16, 2020 - Diana Sierra was dating the director and playing in a band., about not being able to get a girlfriend.. Liliانا Krstic, the subject of my research and my inspiration.. she was totally on fire. .A new class of heterocyclic ethers has been discovered in which the ether bond is made up of only one carbon atom. Although this discovery represents an important advance in the chemistry of heterocyclic ethers, a number of limitations have been found in existing synthetic methodologies for the preparation of the starting materials. Thus, this proposal is to synthesize by known methodology the following new ethers, which can serve as intermediates for the preparation of a new class of arylpiperazinyl piperidine compounds of general Formula I: ##STR3## The method of this invention will be applicable to the preparation of any ether in which the two oxygen atoms of the ether bond are contiguous. However, it is anticipated that the most useful ethers of this type will be the linear ethers of general Formula II: ##STR4## These two ethers may be substituted by a hydroxyl or halogen group. Thus, it may be anticipated that, depending upon the substitution pattern of the ethers, additional isomers of the ethers may be obtained. In addition, it may be anticipated that the ethers of general Formula II may be obtained in a form in which the ether moiety is cyclized by intramolecular nucleophilic displacement by an amine and the amine functions as an N-substituent on the ether. The cyclized ether will have a double bond. However, this substitution pattern is rare in the literature and no method has been published to prepare the cyclized ether. A second class of new heterocyclic ethers has been discovered in which the ether bond is made up of two contiguous carbon atoms. The new ethers may be substituted with a hydroxyl or halogen group and the piperazinyl group may be substituted by a C.sub.1 -C.sub 2d92ce491b
