The Seven Years War (1754–1763) began as one of the major European conflicts of the mid 18th century. While it is most often remembered today as the conflict between the Kingdom of Great Britain and its American colonies, it also involved dozens of other European nations and approximately a quarter of the world's population (a quarter of the population of Asia and Oceania, in particular). Structural analysis of the basis of intron splicing in the chicken glucagon gene. The chicken glucagon gene encodes two alternatively spliced transcripts which differ by only nine nucleotides (nucleotides 23 to 31). These alternative splicing events are dependent on the recognition of a weak 3' splice site located 40 base pairs upstream of the polyadenylation signal. We have analyzed the structural requirements of this splicing reaction using four oligonucleotides spanning the region between positions -40 and +9. These oligonucleotides contain potential stem-loop structures which were tested for the role they might play in the splicing process. A stem-loop structure for the 5' splice site was shown to be able to disrupt the intron duplex; however, the complementary oligonucleotide was not able to inhibit the splicing process. A stem-loop structure within the first exon region was able to inhibit splicing, but the reverse complement of this sequence was unable to function in an analogous manner. A different stem-loop structure, involving the sequence within position -43 to -34, inhibited splicing but its reverse complement did not. In addition, oligonucleotides comprising sequences within this region were able to inhibit the splicing reaction when an intron duplex was present. These results indicate that the formation of the three-way junction (splice sites, branch point and polyadenylation site) is probably the crucial step in the splicing process and that stem-loop structures formed from the sequences between positions -40 and -31 contribute to the correct recognition of this junction. would have replaced Torrance and otherwise preserved the status quo. In that case, the district court should have followed the usual practice in Southern California: it could have entered a stay on remand while reserving its ruling on the pending motion to alter or amend. The judgment is VACATED and the case is REMANDED to the district court with instructions to consider whether it should enter a stay of its order 2:092ce491b
