I have the following problem: I want to run an Hadoop application for every file in a directory. In this example we have a directory called input. We have three files called input.1, input.2 and input.3. We want to have Hadoop compute the following for every file. input.1.0 == 0 input.1.1 == 1 input.2.0 == 0 input.2.1 == 2 input.3.0 == 0 input.3.1 == 3 I tried the following: `hadoop jar application.jar input/*.1 input/input.1` `hadoop jar application.jar input/*.2 input/input.2` `hadoop jar application.jar input/*.3 input/input.3` But it didn't work. What is the correct syntax to run a Hadoop job for every file in the input directory? A: If your *.1, *.2, *.3, etc files are in the same directory as the directory you're running the jobs from, and you have write access to that directory, you could do: `for f in input/*`
